Physics

What makes this a cookbook?

The food you eat probably transitions through more hands, spaces and transformations invisible to you on its way to your plate. From soil to processor to distributor, grocery stores, kitchens.

Technology is similar. Underneath your user interface are layers of abstraction from Javascript to Python to C to assembly language to zeroes and ones.

This zine explores what it means to dig far enough to see what's growing there, and building something that lasts.

We'll explore permacomputing, jailbreaking, and repurposing discarded iOS devices through our recipes. Let's get cooking!

Core Ingredients

WHAT IS JAILBREAKING?

With modern devices, we trade customization for convenience and ease of use. Jailbreaking lets you access layers locked behind proprietary design to access and modify hidden operation systems and code, and make the devices do whatever you want.

It's legal as a result of petitions from EFF for DMCA Exemptions in 2012.

WHAT IS PERMACOMPUTING?

Permacomputing is a term for "resilience and regenerativity in computer and network technology inspired by permaculture". By picking up this zine, you're participating in this philosophy.

<https://permacomputing.net>

Jailbreaking

Required Components:

- Computer: MacOS preferred
- Cable: Original cable if possible
- iOS Device: An iDevice that has been out of use for awhile. It should be able to charge, receive touch input, working buttons, and unlocked (no company management profiles).

Steps:

1. Plug in your iDevice to your computer.
2. Connect your computer and your device to a Wifi network or hotspot.
3. On your computer, navigate to <https://ios.cfw.guide/get-started> (or scan the QR code).
4. Identify your device and follow the provided steps. Each device is unique, with a different processing chip and version.

Package Managers

A package manager is software that supports installing, upgrading, configuring, and removing software for the host system. The native package manager on iOS is the App Store. Jailbreaking allows access to alternative package managers to download and install alternative software.

There are a few package managers out there for jailbroken iOS devices:

- Cydia
- Sileo
- Zebra

Each package manager requests data from a repository, which is a library of software we can request different packages from.

One important repository:

<http://apt.thebigboss.org/repofiles/cydia/>

A compiled list of many repositories for you to explore:

<https://www.ios-repo-updates.com/repositories/>

Suggested Packages

Open up your **package manager** (Cydia, Sileo, or Zebra) and install the following packages.

- BigBoss Recommended Tools: Includes OpenSSH, python, libcc and many useful dev tools

Cydia:

- Mobile Terminal: Command Line Interface (CLI) to directly access and modify files on device.

Sileo / Zebra:

- MTerminal: Command Line Interface (CLI) to directly access and modify files on device.

Known Issues:

Sileo 404: Update the packages first before installing.

HTTPS: If running > 4.3 you might need to install some certificates: tlsroot.litten.ca

Cydia 404: Update DateTime in the menu.

Core Ingredients

WHAT IS TERMINAL?

Terminal.app is an application on Apple devices that gives users text-based access to the operating system.

The graphical user interface (GUI) replaced command line navigation and most users solely rely on Finder.

via Wikipedia Commons

WHAT IS DARWIN?

Darwin is a proprietary "unix-like" system that was first released by Apple in 2000, named by Jobs after Charles Darwin because modern computing was "about evolution". All Apple devices -- computers, tvs, and phones alike -- run on Darwin and its corresponding frameworks.

MORE RESOURCES

Going Further

We are in an age where literacy is at an all time low. We refuse the walled garden, and instead choose to regain power through knowledge.

By unlocking access to Terminal, you can use your iDevice as any computer: unlocked and able to do anything you desire.

There are many ways to reuse these devices; just as many ways to build software.

See the full bibliography for links to these inspiration projects:

- Self-host a web server (someone even got nginx running on ios 7!)
- Run a Minecraft server
- Repurpose the screen to use for a modular synth
